DPP NO. :6

## Topic :- CO-ORDINATE GEOMETRY

2 (a)

The sum of the distance of a point  $P$  from two perpendicular lines in a plane is 1, then the locus of  $P$  is a rhombus

3 (a)

$$\text{In } \triangle DCE, \tan 30^\circ = \frac{150}{CD}$$

$$\Rightarrow CD = \sqrt{3} \times 150$$

Now, In  $\triangle DCF$ ,

$$\tan \theta = \frac{DF}{CD} = \frac{200}{\sqrt{3} \cdot 150} = \frac{4}{3\sqrt{3}}$$

4 (b)

$$2\left(a \sin^2 \frac{C}{2} + c \sin^2 \frac{A}{2}\right)$$

$$= 2\left(a \frac{(s-a)(s-b)}{ab} + c \frac{(s-b)(s-c)}{bc}\right)$$

$$= 2\left(\frac{(s-b)}{b} (s-a + s-c)\right)$$

$$= \frac{2}{b} (s-b)b$$

$$= 2(s-b) = a - b + c$$

5 (c)

Let  $H$  be the orthocenter of  $\triangle OAB$

PEE

$$\therefore (\text{slope of } OP) \cdot (\text{slope of } BA) = -1$$

$$\Rightarrow \left(\frac{y-0}{3-0}\right) \cdot \left(\frac{4-0}{3-4}\right) = -1$$

$$\Rightarrow -\frac{4}{3}y = -1$$

$$\Rightarrow y = \frac{3}{4}$$

$$\therefore \text{Required orthocentre} = (3, y) = \left(3, \frac{3}{4}\right)$$

6 (b)

Let the fourth vertex be  $D(x, y)$

We know that two diagonals of a parallelogram are bisect each other

$$\therefore \frac{-1+7}{2} = \frac{2+x}{2} \Rightarrow x = 4$$

$$\text{and } \frac{-6+2}{2} = \frac{-5+y}{2} \Rightarrow y = 1$$

$$\therefore \text{Fourth vertex of } D \text{ is } (4, 1)$$

7 (c)

We have,  $\cos A \cos B + \sin A \sin B \sin C = 1$

$$\Rightarrow 2 \cos A \cos B + 2 \sin A \sin B \sin C = 2$$

$$\Rightarrow 2 \cos A \cos B + 2 \sin A \sin B \sin C$$

$$= \cos^2 A + \sin^2 A + \cos^2 B + \sin^2 B$$

$$\Rightarrow (\cos A - \cos B)^2 + (\sin A - \sin B)^2 + 2 \sin A \sin B (1 - \sin C) = 0$$

$$\Rightarrow \cos A - \cos B = 0, \sin A - \sin B = 0$$

$$\text{and } 1 - \sin C = 0$$

$$\Rightarrow A = B \text{ and } C = 90^\circ$$

$$\Rightarrow a = b \text{ and } C = 90^\circ$$

8 (d)

We have,  $A + B + C = 180^\circ$

$$\Rightarrow A = 180^\circ - (B + C)$$

$$\Rightarrow \tan A = \tan(180^\circ - B - C)$$

$$\Rightarrow \tan 90^\circ = -\tan(B + C)$$

$$\Rightarrow \infty = -\frac{\tan B + \tan C}{1 - \tan B \tan C}$$

$$\Rightarrow 1 - \tan B \tan C = 0$$

$$\Rightarrow \tan B \tan C = 1$$

9 (b)

Since, the given points lies on a line, then

$$\begin{vmatrix} 1 & 1 & 1 \\ -5 & 5 & 1 \\ 13 & \lambda & 1 \end{vmatrix} = 0$$

$$\Rightarrow 1(5 - \lambda) - 1(-5 - 13) + 1(-5\lambda - 65) = 0$$

$$\Rightarrow -6\lambda = 42 \Rightarrow \lambda = -7$$

10 (a)

The vertices of triangle are  $(0, 0)$ ,  $(3, 0)$  and  $(0, 4)$ . It is a right angled triangle, therefore circumcentre is  $(\frac{3}{2}, 2)$

11 (c)

$$BC = 5, BA = 10$$

Let  $D$  divides  $AC$  in the ratio  $2:1$

$$\therefore \text{Coordinate of } D \text{ is } (\frac{1}{3}, \frac{1}{3})$$

The bisector is the line joining  $B$  and  $D$  is

$$\frac{y-1}{x-5} = \frac{1}{7} \text{ or } x - 7y + 2 = 0$$

12 (b)

$$\text{In } \triangle ECD, \tan 3\alpha = \frac{h}{CD}$$

$$\Rightarrow CD = h \cot 3\alpha \dots(i)$$

$$\text{In } \triangle EBD, \tan 2\alpha = \frac{h}{BD}$$

$$\Rightarrow BD = h \cot 2\alpha \dots(ii)$$

$$\text{In } \triangle EAD, \tan \alpha = \frac{h}{AD}$$

$$\Rightarrow AD = h \cot \alpha \dots(iii)$$

From Eqs. (ii) and (iii),

$$AD - BD = h \cot \alpha - h \cot 2\alpha$$

$$AB = h(\cot \alpha - \cot 2\alpha) \dots(iv)$$

From Eqs. (i) and (ii),

$$BD - CD = h \cot 2\alpha - h \cot 3\alpha$$

$$\Rightarrow BC = h(\cot 2\alpha - \cot 3\alpha) \dots(v)$$

From Eqs. (iv) and (v),

$$\frac{AB}{BC} = \frac{h(\cot \alpha - \cot 2\alpha)}{h(\cot 2\alpha - \cot 3\alpha)}$$

$$= \frac{\cos \alpha}{\sin \alpha} - \frac{\cos 2\alpha}{\sin 2\alpha}$$

$$= \frac{\cos 2\alpha}{\sin 2\alpha} - \frac{\cos 3\alpha}{\sin 3\alpha}$$

$$= \frac{\sin(2\alpha - \alpha)}{\sin \alpha \sin 2\alpha}$$

$$= \frac{\sin(3\alpha - 2\alpha)}{\sin 2\alpha \sin 3\alpha}$$

$$= \frac{\sin 3\alpha}{\sin \alpha} = 3 - 4 \sin^2 \alpha$$

$$= 3 - 2(1 - \cos 2\alpha)$$

$$= 1 + 2 \cos 2\alpha$$

14 (b)

In  $\triangle AEF$ ,  $\tan \phi = \frac{AE}{EF} = \frac{150}{EF}$

$$\frac{5}{2} = \frac{150}{EF}$$

$$\Rightarrow EF = 60 \text{ m}$$

and in  $\triangle ACD$

$$\tan \theta = \frac{AC}{CD}$$

$$\Rightarrow \frac{4}{3} = \frac{150 - h}{60} \quad [\because CD = EF]$$

$$\Rightarrow 80 = 150 - h$$

$$\Rightarrow h = 70 \text{ m}$$

$$\therefore AC = 80 \text{ m and } CD = 60 \text{ m}$$

$$\Rightarrow AD = \sqrt{AC^2 + CD^2}$$

$$= \sqrt{6400 + 3600}$$

$$= \sqrt{10000} = 100 \text{ m}$$

15 (d)

In  $\triangle APC$ ,  $\sin(\angle PAC) = \frac{CP}{AC}$

PE

$$\Rightarrow AC = \frac{r}{\sin \frac{\alpha}{2}} = r \operatorname{cosec} \frac{\alpha}{2} \dots (i)$$

Again, in  $\triangle ABC$ ,  $\sin \beta = \frac{BC}{AC}$

$$\Rightarrow BC = AC \sin \beta$$

$$\Rightarrow H = r \operatorname{cosec} \left( \frac{\alpha}{2} \right) \sin \beta \text{ [from Eq.(i)]}$$

16 (b)

Since,  $\cos A = \frac{b^2 + c^2 - a^2}{2bc}$

$$\Rightarrow b^2 - 2bc \cos A + (c^2 - a^2) = 0$$

It is given that  $b_1$  and  $b_2$  are the roots of this equation

Therefore,  $b_1 + b_2 = 2c \cos A$  and  $b_1 b_2 = c^2 - a^2$

$$\Rightarrow 3b_1 = 2c \cos A \text{ and } 2b_1^2 = c^2 - a^2$$

$$[\because b_2 = 2b_1]$$

$$\Rightarrow 2 \left( \frac{2c}{3} \cos A \right)^2 = c^2 - a^2$$

$$\Rightarrow 8c^2 (1 - \sin^2 A) = 9c^2 - 9a^2$$

$$\Rightarrow \sin A = \sqrt{\frac{9a^2 - c^2}{8c^2}}$$

17 (a)

$$\because (\sqrt{a} + \sqrt{b} + \sqrt{c})(\sqrt{a} + \sqrt{b} - \sqrt{c}) = (\sqrt{a} + \sqrt{b})^2 - c$$

$$= a + b - c + 2\sqrt{ab} > 0$$

$$\therefore \sqrt{a} + \sqrt{b} > \sqrt{c}$$

18 (a)

In  $\triangle ABC$ ,  $\angle A = 30^\circ$ ,  $BC = 10$  cm

$O$  is the centre of circle

$$\therefore \angle BOC = 60^\circ$$

and  $OB$  and  $OC$  are the radius

$$\therefore \angle OBC = \angle OCB = 60^\circ$$

$\Rightarrow \triangle OBC$  is an equilateral triangle

$\therefore$  radius of circle is

$$OB = OC = BC = 10 \text{ cm}$$

Now, area of the circumcircle is  $\pi r^2$

$$= \pi(10)^2 = 100\pi \text{ sq cm}$$

PE

19 (b)

We have,  $R = \frac{abc}{4\Delta}$  and  $r = \frac{\Delta}{s}$

$$\begin{aligned} \therefore \frac{R}{r} &= \frac{abc}{4\Delta} \cdot \frac{s}{\Delta} \\ &= \frac{abc \cdot s}{4\Delta^2} \\ &= \frac{abc \cdot s}{4(s-a)(s-b)(s-c)} \end{aligned}$$

Since,  $a:b:c = 4:5:6$

$$\Rightarrow \frac{a}{4} = \frac{b}{5} = \frac{c}{6} = k \quad (\text{say})$$

$$\begin{aligned} \text{Thus, } \frac{R}{r} &= \frac{(4k)(5k)(6k)}{4\left(\frac{15k}{2} - 4k\right)\left(\frac{15k}{2} - 5k\right)\left(\frac{15k}{2} - 6k\right)} \\ &= \frac{120k^3 \cdot 2}{k^3 \cdot 7 \cdot 5 \cdot 3} = \frac{16}{7} \end{aligned}$$

20 (b)

Given equation of lines are

$$x = 0, y = 0 \text{ and } 3x + 4y = 12$$

Incentre is on the line  $y = x$  (Angled bisector of  $OA$  and  $OB$ )

Angle bisector of  $y = 0$  and  $3x + 4y = 12$  is

$$\pm 5y = 3x + 4y - 12$$

$$\Rightarrow 3x + 9y = 12$$

$$\text{and } 3x - y = 12$$

Here,  $3x + 9y = 12$  internal bisector

So, intersection point of  $y = x$  and  $3x + 9y = 12$  is  $(1, 1)$

$\therefore$  The required point of the incentre of triangle is  $(1, 1)$
