

### Topic :- Chemical Kinetics

1 (c)

$$k = \frac{1}{t} \left[ \frac{x}{a(a-x)} \right]$$

$$k = \frac{1}{500} \left[ \frac{0.2a}{a(a-0.2a)} \right]$$

$$k = \frac{1}{2000a}$$

$$\frac{1}{2000a} = \frac{1}{t} \left[ \frac{0.6a}{a(a-0.6a)} \right]$$

$$t = 3000 \text{ s}$$

2 (a)

$K$  does not change with time; also unit of  $K$  suggest it to be II order.

3 (d)

Follow review of rate of reaction.

4 (b)

Molecularity represents the number of molecules of reactants taking part in an elementary step of reaction.

5 (c)

$$t_{1/2} \propto (a)^{1-n}$$

$$\text{or } t_{1/2} = Z(a)^{1-n}$$

$$\text{or } \log t_{1/2} = \log Z + (1-n) \log a$$

$$\text{or } y = c + mx$$

Thus, slope =  $m = 1 - n$  or  $1 - n = 0 \therefore n = 1$

and for I order reaction  $t_{1/2} = \frac{0.693}{K}$ .

6 (c)

$$t_{1/2} \propto (a)^{1-n}$$

7 (a)

A pseudounimolecular reaction.

8 (d)

Rate becomes  $x^y$  times if concentration is made  $x$  time of a reactant giving  $y^{th}$  order reaction.

$$\text{Rate} = k[A]^n[B]^m$$

Concentration of A is doubled hence  $x=2$ ,  $y=n$  and rate becomes  $= 2^n$  times

Concentration of B is halved, hence  $x=\frac{1}{2}$  and  $y=m$  and rate becomes  $=\left(\frac{1}{2}\right)^m$  times

Net rate becomes  $= (2)^n \left(\frac{1}{2}\right)^m$  times

$$= (2)^{n-m} \text{times}$$

9

**(d)**

For the reaction  $\text{H}_2(\text{g}) + \text{Br}_2(\text{g}) \rightarrow 2\text{HBr}(\text{g})$

$$\text{Rate of reaction} = k[\text{H}_2][\text{Br}_2]^{1/2}$$

Molecularity of reaction  $= 1 + 1 = 2$

$$\text{Order of reaction} = 1 + \frac{1}{2} = \frac{3}{2}$$

10

**(c)**

When heat energy is supplied, kinetic energy of reactant molecules increase. This will increase the number of collisions and ultimately rate of reaction will be enhanced.

11

**(d)**

$$t = \frac{2.303}{K} \log \frac{a}{(a-x)}$$

$$\therefore K = \frac{2.303}{20} \log \frac{1}{0.25} \\ = 0.06931 \text{ min}^{-1}$$

12

**(d)**

I step of mechanism B shows I order in both reactants.

13

**(d)**

$$K_a = A e^{-E_a/RT} \text{ and } K_b = A e^{-E_b/RT}$$

Also,  $K_a > K_b$

$$E_a < E_b$$

Now notice that all the given facts are satisfied.

14

**(c)**

Half-life depends upon rate constant and rate constant ( $K$ ) varies with temperature as

$$K = A \cdot e^{-E_n/RT}; K \text{ increase with temperature. Also } t_{1/2} \propto \frac{1}{K}$$

15

**(d)**

$$\text{Rate} = k[\text{NOBr}_2][\text{NO}] \dots (i)$$

But  $\text{NOBr}_2$  is in equilibrium

$$k_{eq} = \frac{[\text{NOBr}_2]}{[\text{NO}][\text{Br}_2]}$$

$$[\text{NOBr}_2] = k_{eq}[\text{NO}][\text{Br}_2] \dots (ii)$$

Putting the  $[\text{NOBr}_2]$  in (i)

$$\text{rate} = k \cdot k_{eq}[\text{NO}][\text{Br}_2][\text{NO}]$$

$$\text{Hence, rate} = k \cdot k_{eq}[\text{NO}]^2[\text{Br}_2]$$

$$\text{rate} = k'[\text{NO}]^2[\text{Br}_2]$$

where,  $k' \cdot K_{eq}$   
the order, of reaction with respect to  $NO(g)$  is 2

16

**(a)**

For zero order reaction, for example,

$$\frac{-d[A]}{dt} = k[A]^0$$

$$\frac{-d[A]}{dt} = k$$

17

**(d)**

The increase in collision frequency brings in an increase in effective collisions and thus, rate of reaction increases.

18

**(a)**

$$t_{1/2} \propto \frac{1}{a^{n-1}}$$

When  $n = 4$

$$t_{1/2} \propto \frac{1}{a^3}$$

Hence, order of reaction = 4

19

**(d)**

There are two different reactants (say A and B).

Thus, it is a bimolecular reaction .

$$\text{If } \frac{dx}{dt} = k[A][B]$$

It is second order reaction

$$\text{If } \left(\frac{dx}{dt}\right) = k[A]$$

$$\text{Or } = k[B]$$

It is first order reaction .

Molecularity is independent of rate ,but is the sum of the reacting substance thus it cannot be unimolecular reaction .

20

**(a)**

$$\text{rate} = K[A][B]^2$$

$$\therefore 10^{-2} = K[1][1]^2$$

$$\text{or } K = 10^{-2} \text{ litre}^2 \text{ mol}^{-2} \text{ sec}^{-1}$$

$$\begin{aligned} \therefore \text{rate II} &= 10^{-2}[0.5] \times [0.5]^2 \\ &= 1.2 \times 10^{-3} \text{ mol/litre-sec} \end{aligned}$$
