#### CBSE Test Paper 04

#### **Chapter 5 Arithmetic Progression**

- **1.** Which term of the A.P. 121, 117, 113, ..... is its first negative term? **(1)** 
  - a. 32
  - b. 33
  - c. 30
  - d. 31
- **2.** The A.P. whose third term is 16 and the difference of 5th term from the 7th term is 12, then the A.P. is **(1)** 
  - a. 4, 11, 18, 25, .....
  - b. 4, 14, 24, 34, .....
  - c. 4, 10, 16, 22, .....
  - d. 4, 6, 8, 10, .....
- 3. If  $a_1 = 4$  and  $a_n = 4a_{n-1} + 3$ , n > 1, then the value of  $a_4$  is (1)
  - a. 320
  - b. 329
  - c. 319
  - d. 300
- **4.** In an A.P. it is given that a = 5, d = 3 and  $a_n = 50$ , then the value of 'n' is (1)
  - a. 16
  - b. 18
  - c. 20
  - d. 15

5. If the second term of an AP is 13 and its fifth term is 25, then its 7th term is (1)

- a. 37
- b. 33
- **c.** 39
- d. 35
- 6. In the A.P. 2, x, 26 find the value of x. (1)
- 7. Find 9<sup>th</sup> term of the A.P.  $\frac{3}{4}, \frac{5}{4}, \frac{7}{4}, \frac{9}{4}, \dots$  (1)
- 8. If they form an AP, find the common difference d and write three more terms. 0.2,

0.22, 0.222, 0.2222, .... **(1)** 

- **9.** If sum of first n terms of an AP is  $2n^2 + 5n$ . Then find S<sub>20</sub>. (1)
- 10. Find the sum of each of the following APs: 0.6, 1.7, 2.8,... to 100 terms. (1)
- 11. The 4th term of an A.P. is zero. Prove that the 25th term of the A.P. is three times its 11th term. (2)
- 12. In a certain A.P. 32<sup>th</sup> term is twice the 12<sup>th</sup> term. Prove that 70<sup>th</sup> term is twice the 31<sup>st</sup> term. (2)
- **13.** The sum of first six terms of an arithmetic progression is 42. The ratio of its 10th term to its 30th term is 1 : 3. Calculate the first and the thirteenth term of the A.P. **(2)**
- **14.** Find the sum of the first 25 terms of an A.P. whose  $n^{th}$  term is given by  $a_n = 7 3n$ . (3)
- 15. The 12th term of an AP is -13 and the sum of its first four terms is 24. Find the sum of its first 10 terms. (3)
- **16.** Prove that the  $11^{\text{th}}$  term of an A.P. cannot be  $n^2 + 1$ . Justify your answer. (3)
- 17. There are 25 trees at equal distances of 5m in a line with a water tank, the distance of the water tank from the nearest tree being 10m. A gardener waters all the trees separately, starting from the water tank and returning back to the water tank after watering each tree to get water for the next. Find the total distance covered by the gardener in order to water all the trees. (3)

- **18.** Let there be an A.P. with first term 'a', common difference 'd'. If  $a_n$  denotes its n<sup>th</sup> term and  $S_n$  the sum of first n terms, find n and  $a_n$ , if a = 2, d = 8 and  $S_n = 90$ . **(4)**
- 19. Find the sum of all natural numbers between 200 and 300 which are divisible by 4. (4)
- **20.** In a garden bed, there are 23 rose plants in the first row, 21 are in the 2<sup>nd</sup>, 19 in 3<sup>rd</sup> row and so on. There are 5 plants in the last row. How many rows are there of rose plants? Also find the total number of rose plants in the garden. **(4)**

# **CBSE Test Paper 04**

# **Chapter 5 Arithmetic Progression**

### Solution

### 1. a. 32

2.

3.

4.

| Explanation: Here $a=121, d=117-121=-4$                                  |
|--|
| For the first negative term, $a_n < 0$                                   |
| $\Rightarrow$ 121 + $(n-1)$ $(-4) < 0$                                   |
| $\Rightarrow 121-4n+4 < 0$   |
| $\Rightarrow \! 125 \! - \! 4n < 0$                                      |
| $\Rightarrow n > rac{125}{4}$   |
| $\Rightarrow$ $n > 31rac{1}{4}$   |
| Therefore 32nd term is the first negative term.                          |
| c. 4, 10, 16, 22,  |
| Explanation: Given: $a_3 = 16 \Rightarrow a + 2d = 16$ (i)               |
| And $a_7-a_5= {12}{\Rightarrow}a+6d-a-4d=12$                             |
| $\Rightarrow 2d = 12 \Rightarrow d = 6$                                  |
| Putting value of $d$ in eq. (i), we get                                  |
| a+2	imes 6=16  |
| $\Rightarrow a = 4$  |
| Therefore, A.P. is 4, 10, 16, 22,  |
| c. 319   |
| Explanation: Given: $a_1=4 	ext{ and } a_n=4a_{n-1}+3, \ n>1,$           |
| $\therefore a_2 = 4a_{2-1} + 3 = 4a_1 + 3 = 4 	imes 4 + 3 = 16 + 3 = 19$ |
| and $a_3 = 4a_{3-1} + 3 = 4a_2 + 3 = 4 \ 	imes 19 + 3 = 76 + 3 = 79$     |
| and $a_4 = 4a_{4-1} + 3 = 4a_3 + 3 = 4 \ 	imes 79 + 3 = 316 + 3 = 319$   |
| a. 16  |
|  |

**Explanation:** Given: a = 5, d = 3 and  $a_n = 50$ 

$$egin{aligned} \therefore a_n &= a + (n-1) \, d \ \Rightarrow 50 &= 5 + (n-1) imes 3 \ \Rightarrow 45 &= (n-1) imes 3 \ \Rightarrow rac{45}{3} &= ext{n-1} \end{aligned}$$

$$\Rightarrow n - 1 = 15$$
$$\Rightarrow n = 16$$

5. b. 33

**Explanation:** Given:  $a_2 = 13$  $\Rightarrow a + (2-1)d = 13$  $\Rightarrow a + d = 13$  .....(i) And  $a_5=25$  $\Rightarrow a + (5-1)d = 25$  $\Rightarrow a + 4d = 25$  ......(ii) Solving eq. (i) and (ii), we get a = 9 and d = 4 $\therefore a_7 = a + (7 - 1) d$ =9+(7-1) imes 4 $= 9 + 6 \times 4$ = 9 + 24 = 336. 2, x and 26 are in A.P.  $\therefore x - 2 = 26 - x$ or. x + x = 26 + 2or, 2x = 28or,  $x = \frac{28}{2}$  = 14 7. Given, A.P =  $\frac{3}{4}, \frac{5}{4}, \frac{7}{4}, \frac{9}{4}, \dots$ First term(a) =  $\frac{3}{4}$ Common difference (d) =  $\frac{5}{4} - \frac{3}{4} = \frac{2}{4}$ As we know,  $a_n = a + (n-1)d$  $\Rightarrow a_9 = rac{3}{4} + (9-1) imes rac{2}{4}$  $= \frac{3}{4} + 8 \times \frac{2}{4} \\ = \frac{3}{4} + \frac{16}{4} = \frac{19}{4}$ 

8. 0.2, 0.22, 0.222, 0.2222, 000

 $a_2 - a_1 = 0.22 - 0.2 = 0.02$ 

 $a_3 - a_2 = 0.222 - 0.22 = 0.002$ 

As  $a_2$  -  $a_1 \neq a_3$  -  $a_2$  , the given list of numbers does not form an AP.

10. Here, a = 0.6, d = 1.7 - 0.6 = 1.1 and n = 100Now we know that,  $S_n = \frac{n}{2} [2a + (n - 1)d]$ Therefore,  $S_n = \frac{100}{2} [2 \times 0.6 + (100 - 1)(1.1)]$ = 50[1.2 + 108.9] $= 50 \times 110.1$ = 5505

11. We have,

 $a_4 = 0$  a + 3d = 0 3d = -aor ....3d.....a......(i) Now,  $a_{25} = a + 24d$  = -3d + 24d [Putting value of a from eq(i)] = .21d......(ii)  $a_{11} = a + 10d$  = -3d + 10d = 7d......(iii) From eq(ii) and (iii), we get  $a_{25} = 21 d$   $a_{25} = 3(7d)$  $a_{25} = 3a_{11}$ 

12. Let the 1st term be a and common difference be d.

an = a + (n-1)d According to the question,  $a_{32} = 2a_{12}$ a +31d = 2 (a + 11d) a + 31d = 2a + 22d a - 2a = 22d - 31d a = 9d  $a_{70} = a + 69d = 9d + 69d = 78d$  $a_{31} = a + 30d = 9d + 30d = 39d$  $a_{70} = 78d$  $a_{70} = 2(39d)$  $a_{70} = 2a_{31}$ Hence Proved.

13. Let a be the first term and d be the common difference of the given A.P. Then,

$$\therefore .S_{6} = 42$$

$$\frac{\frac{6}{2}(2a + 5d) = 42}{2a + 5d = 14....(i)}$$
It is given that
$$a_{10} : a_{30} = 1:3$$

$$\Rightarrow \frac{a+9d}{a+29d} = \frac{1}{3}$$

$$3a + 27d = a + 29d$$

$$2a = 2d$$

$$a = d....(ii)$$
From (i) and (ii) we get
$$a = d = 2$$
Hence  $a_{13} = 2 + 12 \times 2 = 26$  and  $a_{1} = 2$ 

14. Given,  $a_n = 7 - 3n$ 

Put n = 1,  $a_1 = 7 - 3 \times 1 = 7 - 3 = 4$ Put n = 2,  $a_2 = 7 - 3 \times 2 = 7 - 6 = 1$ Common difference(d) = 1 - 4 = -3

$$S_{n} = \frac{n}{2} [2a + (n-1)d]$$

$$S_{25} = \frac{25}{2} [2 \times 4 + (25-1)(-3)]$$

$$= \frac{25}{2} [8 - 72]$$

$$= \frac{25}{2} \times -64$$

$$= -800$$

- 15.  $12^{\text{th}} \text{ term} = T_{12} = -13$ ⇒ a + 11d = -13...(i)  $S_4 = 24$ ⇒  $\frac{4}{2} [2a + 3d] = 24$ ⇒ 2[2a + 3d] = 24⇒ 2a + 3d = 12...(ii)Multiplying equation (i) by 2, we get 2a + 22d = -26...(iii)Subtracting (ii) from (i), we get 19d = -38⇒ d = -2⇒ a + 11(-2) = -13...[from (i)]⇒ a = 9∴ Sum fo first 10 terms,  $S_{10} = \frac{10}{2} [2(9) + 9(-2)] = 5[18 - 18] = 5 \times 0 = 0$
- 16. Let n<sup>th</sup> term of A.P.

 $a_n = n^2 + 1$ Putting the value of n = 1, 2, 3, .... we get  $a_1 = 1^2 + 1 = 2$   $a_2 = 2^2 + 1 = 5$   $a_3 = 3^2 + 1 = 10$ The obtained sequence = 2, 5, 10, 17..... Its common difference  $a_2 - a_1 = a_3 - a_2 = a_4 - a_3$ or,  $5 - 2 \neq 10 - 5 \neq 17 - 10$  Since the sequence has no. common difference

Hence,  $n^2 + 1$  is not a form of n<sup>th</sup> term of an A.P.

17. Assume that gardener is standing near the well initially, and he did not return to the well after watering the last tree.

distance covered by gardener to water 1<sup>st</sup> tree and return to the initial position=10m + 10m = 20m.

Distance covered by gardener to water  $2^{nd}$  tree and return to the initial position =15m + 15m =3 0m.

Distance covered by gardener to water  $3^{rd}$  tree and return to the initial position =20m + 20m = 40m.

: Distance covered by the gardener to water the plants are in AP.

Here a = 20, d = 10

Total distance covered by the gardener is given by Sn, where n = 25.  $\Rightarrow Sn = \frac{25}{2} [2(20) + (25 - 1)10] = 3500.$ 

Thus, the total distanc<mark>e cov</mark>ered b<mark>y the</mark> gardener is 3500m.

18. Given that, a = 2, d = 8 and  $S_n = 90$ .

As, 
$$S_n = \frac{n}{2}[2a + (n - 1)d]$$
  
 $90 = \frac{n}{2}[4 + (n - 1)8]$   
 $90 = n[2 + (n - 1)4]$   
 $90 = n[2 + 4n - 4]$   
 $90 = n(4n - 2) = 4n^2 - 2n$   
 $4n^2 - 2n - 90 = 0$   
 $4n^2 - 20n + 18n - 90 = 0$   
 $4n(n - 5) + 18(n - 5) = 0$   
 $(n - 5)(4n + 18) = 0$   
Either  $n = 5$  or  $n = -\frac{18}{4} = \frac{-9}{2}$   
However, n can neither be negative nor fractional.  
Therefore,  $n = 5$   
 $a_n = a + (n - 1)d$   
 $a_5 = 2 + (5 - 1)8$ 

= 2 + 4(8) = 2 + 32 = 34

19. All the numbers between 200 and 300 which are divisible by 4 are 204, 208, 212, 216,

```
...., 296
Here, a<sub>1</sub> = 204
a_2 = 208
a<sub>3</sub> = 212
a<sub>4</sub> = 216
a_2 - a_1 = 208 - 204 = 4
a_3 - a_2 = 212 - 208 = 4
a_4 - a_3 = 216 - 212 = 4
a_2 - a_1 = a_3 - a_2 = a_4 - a_3 = \dots (= 4 \text{ each})
This sequence is an arithmetic progression whose common difference is 4.
Here, a = 204
d = 4
l = 296
Let the number of terms be n. Then,
l = a + (n - 1)d
\Rightarrow 296 = 204 + (n - 1)4
\Rightarrow 92 = (n - 1)4
\Rightarrow n - 1 = 23
\Rightarrow n = 23 + 1
\Rightarrow n = 24
\therefore S_n = \frac{n}{2}(a+l)
=\left(\frac{24}{2}\right)(\overline{204}+296)
=(12)(500)
= 6000.
```

Hence, the sum of all the natural numbers between 200 and 300 which are divisible by 4 is 6000.

20. The number of rose plants in the 1<sup>st</sup>, 2<sup>nd</sup>, ..... are 23,21,19, ......5

a = 23, d = 21 - 23 = -2,  $a_n = 5$   $\therefore a_n = a + (n - 1)d$ or, 5 = 23 + (n - 1)(-2) or, 5 = 23 - 2n + 2 or, 5 = 25 - 2n or, 2n = 20 or, n = 10

Total number of rose plants in the flower bed,

$$S_{n} = \frac{n}{2} [2a + (n-1)d]$$

$$S_{10} = \frac{10}{2} [2(23) + (10^{-1})(-2)]$$

$$= 5[46 - 20 + 2]$$

$$S_{10} = 5(46 - 18)$$

$$= 5 (28)$$

$$S_{10} = 140$$
